This a very basic program that allows you to view element types in the xsd-schema. You can choose which file to use with the -f command line argument. The program takes as input an xsd-schema and generates as output all the types, elements, attributes and the corresponding tags that can be found on the xsd-schema. Also the -i command line argument allows you to specify the location of the xsd-schema that you want to use. The Types are created in three parts Element Types Elements Attributes As we can see in the example the program generates: 3 types: First we can see that there are two types, element types and attributes. Inside the element types they are separated by commas and the attributes by space and new line. Inside the elements part it is possible to see that the type is being generated. The tag goes before the values and the closing tag. Inside the attributes part it is possible to see that the attribute is being generated. The tag goes before the attribute name and the values. The tag is separated from the values by commas. Usage Notes: The command line arguments that ScrewXml Activation Code provides are: -i: {schema-location} Loads the xsd-schema of the file and uses it -f: {schema-location} Specifies the location of the xsd-schema that the program will load The xsd-schema location is optional -l: {file} Creates the xml file without saving it on disk -p: {file} Creates the xml file without saving it on disk -T: {destination-directory} Saves the xml file in the specified directory -v: {verbosity} Sets the verbosity of the output. Possible values are 'info','verbose' and 'quiet'. To create the example xml file we can specify the location of the xsd-schema. The location is specified with the -f argument. Additional help will be displayed, that explain the available arguments and the program output. If you are a developer that wants to run the program from the command line and get the output as well as the generated xml file, a very basic example is shown here. I
